

What Others Say About CipherTrust...

"Best overall solution; excellent self-defense and antispam; good content filtering. Outstanding combination of search capabilities. Refers to widest assortment of spam lists."

Information Security

"CipherTrust has good logic and the appliance packaging is attractive, offering a comprehensive approach from the network up."

Gartner

"Enterprises looking for a way to provide secure email communications while keeping email servers free of viruses, spam and hacks should consider CipherTrust's IronMail email gateway appliance. In eWeekLab tests, IronMail consistently blocked attacks and stopped viruses from penetrating the network. We believe IronMail would ably address the security needs of large email systems when a dedicated appliance is the best option; organisations such as government agencies or financial companies would reap the greatest benefits from IronMail email infrastructure protection."

eWeek

"Best Corporate Antispam Solution."

PC Magazine

"The IronMail appliance by CipherTrust is a comprehensive device to protect the corporate email system from hacker attacks and other threats...IronMail is a product worth evaluating simply for its email firewall and email intrusion detection abilities. The capabilities of IronMail in these areas address real and growing threats that are not receiving enough attention from IT and security personnel, and for which there are very few such solutions on the market."

Giga Information Group

"However, an even better example of the overall concept [application level security] is IronMail from CipherTrust, combining a comprehensive set of multilayer inspection and protection mechanisms into a single device (including access control, protocol inspection, intrusion detection, antivirus, anti-spam, content filtering, encryption, and anomaly detection)."

META Group

"CipherTrust has put together a comprehensive suite of security tools to address all aspects of email security."

Spire Security
